Camera Interface Details

Mode 1: Fixed line scan rate mode

- Matrox Genesis sends the EXPOSURE1 (EXSYNC) signal to the camera; the camera awaits the rising edge of the signal and after a short (constant) delay initiates line readout.
- **Line rate:** The EXPOSURE2 (PRIN) period in the DCF specifies the line rate of the camera. The EXPOSURE2 (PRIN) period is currently set to **2810 pixels**. With a **25 MHz** pixel clock, this translates to an **8.9 kHz** line rate.
- **Virtual frame rate:** The virtual frame rate for the current settings of the DCF is **17.3 Hz**.
- **Exposure time:** The time between the rising edge of the EXPOSURE2 (PRIN) and EXPOSURE1 (EXSYNC) signals is the exposure time. The default exposure time for this DCF is **100 μ s**. In order to select the exposure time, the width and deployment time of EXPOSURE1 (EXSYNC) and EXPOSURE2 (PRIN) must be set in Matrox Intellicam. The exposure time of the camera can be modified in the DCF using Matrox Intellicam, Genesis Native Library function **imCamControl()** or with the MIL digitizer control function **MdigControl()**. Refer to the appropriate manual or user guide for additional information.
- **Maximum / minimum exposure time:** Since the Matrox Genesis timer is 16-bit wide, the maximum exposure time is calculated to be $65536/25 \text{ MHz} = \mathbf{2.62 \text{ ms}}$. For proper operation, the exposure signal must remain inactive for a minimum of 6 clock pulses before being asserted. Therefore the minimum exposure time is **240 ns**.
- **Smallest exposure time increment:** The pixel clock is the reference clock that the exposure time is being set by. The smallest increment of the exposure time is **40 ns**.

Mode 2 : Variable line scan rate

- Once it has received the external trigger signal, Matrox Genesis sends the EXPOSURE2 (PRIN) signal to the camera to initiate exposure. Matrox Genesis will send the EXPOSURE1 (EXSYNC) signal to the camera following a delay that is equal to the desired exposure time. A short (constant) delay will follow after receiving the EXPOSURE1 (EXSYNC), followed by the camera sending the HSYNC (LVAL) signal to the Matrox Genesis to initiate line readout.
